**AMENDMENTS TO THE CLAIMS:**

Claim 1. (Previously presented) A one-way clutch comprising:

a cage press fitted to an inner peripheral face of an outer race;

a spring arranged along an inner diameter side of said cage and comprising pockets and annular portions comprising corrugated parts; and

a sprag assembly comprising a plurality of sprags, wherein said sprags are inserted into respective pockets of said spring and into said cage;

wherein, at a position where a largest repulsive force is exerted from said cage to said spring, an overlapped portion is formed by one end portion of said spring overlapping the other end portion of said spring so that rigidity of said spring is increased,

wherein said overlapped portion of said spring is positioned by one of said corrugated parts at the one end portion of said spring and an edge portion of the other end portion of said spring, and

wherein the repulsive force exerted by said cage to said spring varies with respect to position.

Claim 2. (Original) The one-way clutch according to Claim 1, wherein a bent portion is formed in said edge portion of the other end portion of said spring so as to be curved along a round portion from a foot to a crest of said corrugated part, and said bent portion and said corrugated part define a position of said overlapped portion of said spring.

Claim 3. (Previously presented) A one-way clutch comprising:

a cage press fitted to an inner peripheral face of an outer race;

4

a spring arranged along an inner diameter side of said cage, said spring comprising pockets and annular portions comprising corrugated parts and smooth parts;

a sprag assembly comprising a plurality of sprags, said each sprag is inserted into a pocket of said spring and a pocket of said cage, respectively; and

an overlapped portion provided on said spring at a position where a largest repulsive force is exerted from said cage to the spring, and formed by a first end of said spring that overlaps with a second end of said spring;

wherein, at said overlapped portion, an edge portion of said second end extends to at least a boundary between said corrugated part and said smooth part, and

wherein the repulsive force exerted by said cage to said spring varies with respect to position.

Claim 4. (Previously presented) The one-way clutch according to Claim 3, wherein said edge portion of the second end of said spring fits into a curve in said spring between said smooth part and said corrugated part.

Claim 5. (Previously presented) The one-way clutch of claim 1, wherein said edge portion of the other end portion is positioned against a foot of said corrugated part at the one end portion.

Claim 6. (Currently amended) The one-way clutch of claim 5 ~~4-1~~, wherein said edge portion is further curved along a round portion of the foot of the corrugated part.

5

Claim 7. (Previously presented) The one-way clutch of claim 1, wherein the cage comprises an elliptical shape

Claim 8. (Canceled).

Claim 9. (Previously presented) The clutch of claim 5, wherein the spring comprises:  
a corrugated part;  
a smooth part; and  
one end of the spring abuts a foot of the corrugated part.

Claim 10. (Previously presented) The clutch of claim 6, wherein the one end of the spring comprises a bent portion.

Claim 11. (Previously presented) The clutch of claim 7, wherein the bent portion comprises a curve that matches a curve in the foot of the corrugated part.

Claim 12. (Currently amended) The clutch of claim 6, wherein the foot of the corrugated part defines an the intersection between the corrugated part and a smooth part of the spring.

Claim 13. (Previously presented) The clutch of claim 5, wherein the cage comprises an elliptical shape as a result of being press fit into the inner peripheral face of the outer race.

Claim 14. (Previously presented) The clutch of claim 5, wherein the spring and the cage

define a pocket.

Claim 15. (Previously presented) The clutch of claim 11, further comprising a sprag in the pocket.

Claim 16. (Previously presented) The clutch of claim 12, wherein the spring further comprises a tongue that rotationally biases the sprag.

Claim 17. (Previously presented) The clutch of claim 5, further comprising an inner race positioned inside the spring.
